## World Risk Poll 2021: A Resilient World? Understanding vulnerability in a changing climate

#### 2021 World Risk Poll Resilience Index

The Resilience Index score is between 0 and 1, with a higher score indicating greater resilience. The overall score is calculated from scores in four areas:

1. 'Individual' resilience is the average of two survey items which measure agency/self-efficacy and educational attainment.

2. 'Household' resilience is the average of three metrics: one measuring financial assets, one measuring planning and one is the average of two survey items that measure access to communications.

3. 'Community' resilience is the average of two metrics: social capital and local infrastructure. These two metrics are each created from the average of three survey items.

4. 'Society' resilience is the average of three metrics: discrimination (scored from five survey items), government caring about wellbeing (one item), and a four-item index of confidence in national institutions.

# RESILIENCE INDEX

Country Ranking (out of 111) 35th

How much do you think the government cares about you and your wellbeing? How much do you think most of your neighbours care about you and your wellbeing?

Considering the sources of information you would access, which one would

you trust MOST to provide information about a possible disaster in the city or area where you live?
