### World Risk Poll 2021: A Resilient World? Understanding vulnerability in a changing climate

#### 2021 World Risk Poll Resilience Index

The Resilience Index score is between 0 and 1, with a higher score indicating greater resilience. The overall score is calculated from scores in four areas:

1. 'Individual' resilience is the average of two survey items which measure agency/self-efficacy and educational attainment.

2. 'Household' resilience is the average of three metrics: one measuring financial assets, one measuring planning and one is the average of two survey items that measure access to communications.

3. 'Community' resilience is the average of two metrics: social capital and local infrastructure. These two metrics are each created from the average of three survey items.

4. 'Society' resilience is the average of three metrics: discrimination (scored from five survey items), government caring about wellbeing (one item), and a four-item index of confidence in national institutions.

#### World Risk Poll 2021: A Resilient World? Understanding vulnerability in a changing climate

Thinking about the last disaster you experienced, what type of event was it?

Note: Fewer than 100 people answered this question. Estimates based off such small sample sizes will have a large margin of error.

Have any of the following happened to you in the past 12 months, or not? Have you

Have you…? (results by in-country income quintiles)
